

ITSM Architecture

1. CA probe provides integration from Cloudwatch to Spectrum.
2. Lambda listens for CodePipeline deployments which need to be converted to CIs in CA. This could also perform the tag validation and correction function.
3. New Configuration Item API service will add CIs to CA SDM
4. Configuration and App Changes are captured by Config and integrated to CA as change orders through the new CO API service.
5. Resource tags are validated against a database.
6. Resource tags are corrected if necessary.
